01 — EXECUTIVE SUMMARY

What Green365 Is

Green365 (G365) is an Ethereum-based community token organized around one repeatable idea: **one green action every day**. The project pairs a fixed-supply, publicly verified ERC-20 token with a transparency-first operating model — every structural claim in this document is checkable on-chain or in the project's public repository.

G365 is currently **live on Ethereum Mainnet**. Total supply is fixed at **365,000,000,000 G365**, minted once at deployment with no mint function available afterward. The verified contract contains no pause, blacklist, transfer-tax, or owner-controlled balance functions.

Green365 operates in two phases. **Phase 1**, the current phase, is a community and meme token with no promised utility, no staking, no dividend, and no guaranteed financial return. **Phase 2** is a future, funding-dependent direction toward treasury-supported environmental actions; it is not committed, timed, or funded as of this document's publication.

This whitepaper explains the project. A separate, continuously updated **Transparency Page** carries current facts, wallet addresses, and transaction links, and takes precedence over this document if the two ever diverge.

02 — MISSION

One Green Action Every Day

Green365 promotes simple environmental actions that can be completed regularly without large donations, specialized equipment, or major organizational support. The premise: small, consistent actions — picking up litter, clearing a storm drain, tidying a shared space — compound into cleaner, more welcoming environments when repeated daily across a community.

Three principles guide how the project operates:

- **One practical action at a time** — real, repeatable actions, not one-time stunts or sweeping claims.
- **Verifiable information over unsupported claims** — a verified contract, a public transparency page, and a public repository stand in place of "trust me."
- **Community trust before token promotion** — environmental content comes first in every channel; the token is never the point of a post.

03 — WHY GREEN365 EXISTS

Closing the Gap Between Branding and Mechanics

Most tokens built around an environmental or charitable theme separate the theme from the mechanics: the branding promises impact, while the token itself carries no structural connection to any real action, and no way for a holder to verify that claims are true. Green365 was built to close that gap in the ways that are actually within a small, self-funded project's control — publish a fixed-supply contract with no privileged functions, document every wallet's purpose, and keep every technical claim checkable rather than asserted.

The "365" in the name is literal: one green action, documented, every day of the year — regardless of token price, market conditions, or attention. The token exists to give that habit a coordination point and, if Phase 2 is eventually funded, a treasury mechanism for supporting real-world action at a scale an individual cannot reach alone. **It is not positioned, and should not be understood, as an investment vehicle.**

Green365 is built and operated by a single, pseudonymous founder on a launch budget under \$2,000. That constraint shapes the project's choices directly: no paid third-party audit at this stage, no team to distribute trust across, and a corresponding reliance on checkable facts — a verified contract, a public ledger, a documented allocation — rather than reputation, credentials, or promises.

Pseudonymity is a deliberate choice, not an evasion: the brand is designed to be judged on the consistency of what it does and the accuracy of what it publishes, rather than on a personal identity that offers no additional way to verify anything.

04 — TOKEN OVERVIEW

G365 at a Glance

G365 is a standard ERC-20 token built on OpenZeppelin's audited base contracts rather than custom token logic. The full supply was minted once, at deployment, directly to the wallets described in Section 5. There is no presale contract, no vesting contract beyond what is described in this document, and no mechanism for creating additional tokens after deployment.

FIELD	VALUE
Token Name	Green365
Token Symbol	G365
Standard	ERC-20
Network	Ethereum Mainnet
Decimals	18
Total Supply	365,000,000,000 G365 (fixed)
Contract Address	0xa46b8c767d7a3881ec5c09857b96d245e4b9a6a9
Built On	OpenZeppelin Contracts v5.6.0
Compiler	Solidity v0.8.34 (optimization disabled)
License	MIT

Contract address verified against the source published in the project's public repository. Always confirm the address on this document, the Transparency Page, and Etherscan before interacting with the contract.

05 — FIXED SUPPLY AND ALLOCATION

Where the Supply Sits

Total supply is fixed at **365,000,000,000 G365**. It was minted once, in the constructor, at contract deployment. No function in the verified contract can increase supply afterward.

WALLET	PURPOSE	TOKENS	%
Liquidity Reserve	Funds Uniswap pool creation, paired with ETH	146,000,000,000	40%
Community Treasury	Ecosystem growth, community rewards, partnerships	110,000,000,000	~30.1%
Green Projects	Phase 2 environmental action fund (funding-dependent)	73,000,000,000	20%
Founder Vesting	Founder allocation	36,000,000,000	~9.9%
Deployment (pass-through)	Staging only — distributes to wallets above, holds no long-term balance	0	0%

The deployment wallet is a pass-through staging wallet used to deploy the contract and distribute tokens to the allocation wallets above. It is not intended to hold a long-term allocation, and its balance is expected to be 0 shortly after deployment.

06 — SMART CONTRACT DESIGN AND SECURITY PROPERTIES

What the Verified Code Does — and Doesn't — Do

The following properties are confirmed directly from the contract's verified, publicly readable source code:

- ✓ **No mint function after deployment** — the entire 365,000,000,000 supply was minted once, at deploy time. Total supply cannot increase.
- ✓ **No pause function** — transfers cannot be frozen by anyone, including the owner.
- ✓ **No blacklist function** — no address can be blocked from transacting.
- ✓ **No hidden transfer fees** — standard ERC-20 transfer logic only, unmodified from OpenZeppelin's audited base.
- ✓ **No owner function that changes token balances** — the ownership role cannot mint, seize, or reassign tokens.
- ✓ **Built on OpenZeppelin Contracts v5.6.0** — industry-standard, widely audited base implementation, not custom-written token logic.

Using OpenZeppelin's standard contracts reduces unnecessary custom-code risk, but it does not mean this deployment has received an independent professional security audit. **Independent paid audit: not completed.** The project operates on a launch budget below \$2,000; current safeguards are minimal contract logic, a widely audited base implementation, public source-code verification, and public transaction records — these are not a substitute for a professional audit.

07 — OWNERSHIP POLICY

Current Ownership Status

Ownership has not been renounced. Ownership is temporarily retained to allow future updates to the project profile and administrative tasks. This is a present, disclosed fact, not a temporary omission — it is restated in full in Section 13, Risks and Disclosures.

The Green365 contract contains no owner-controlled minting, pausing, blacklisting, transfer-tax, or balance-modification functions. This means the ownership role has no ability to affect token supply, transfers, balances, or fees — regardless of who holds it, and regardless of whether ownership is ever renounced.

On Renouncing Ownership

Renouncing ownership permanently removes administrative recovery through the ownership role. In this contract, renouncing does not change what the contract technically can and cannot do — the functions listed above simply do not exist, with or without an owner. What renouncing changes is a trust signal: it closes off the ownership role entirely and removes any possibility of that role being used, transferred, or compromised in the future.

This document does not commit to a specific renouncement date. Any change to ownership status will be published on the Transparency Page with a transaction link at the time it happens.

08 — LIQUIDITY AND LP LOCK PLAN

Pool Creation and Lock Commitment

- G365 is planned to be paired with ETH on Uniswap using the Liquidity Reserve allocation (146,000,000,000 G365, 40% of total supply).
- The exact initial G365 contribution, paired ETH amount, pool version, and fee tier will be published on the Transparency Page at the time the pool is created.
- LP tokens received from Uniswap will be locked via Unicrypt or Team.Finance for a minimum of 6–12 months, with the lock transaction published within one hour of the position being created.
- Lock-provider compatibility will be confirmed before the position is created. This step will not be skipped regardless of budget or timing pressure.

ITEM	STATUS
Mainnet contract deployed	Live
Mainnet source code verified	Live
Initial liquidity transaction	Planned
Liquidity-lock provider selected	Planned
Liquidity position locked	Planned
Lock transaction published	Planned
Unlock date published	Planned

Unlocked or founder-controlled liquidity is the most common rug-pull vector in token launches, because liquidity can be removed unilaterally. A verifiable lock reduces this specific risk. It does not remove token-price volatility, smart-contract risk, market risk, or general project risk — see Section 13.

09 — PHASE 1

Current Phase: Community Token

Green365 is currently an environmental community and meme token. **Phase 1 has no promised utility.** Holding G365 does not entitle anyone to any product, service, dividend, staking reward, or share of profits.

- No guaranteed product or service
- No staking rewards
- No dividend
- No profit sharing or company ownership
- No guaranteed token value
- No guaranteed financial return

10 — FUTURE DIRECTION: PHASE 2

Treasury-Funded Environmental Action

Future treasury-funded environmental actions may include cleanups, tree planting, offsets, or other verified environmental programs, drawn from the Green Projects allocation described in Section 5. **Phase 2 represents a possible future direction and is funding-dependent** — it is not promised at this stage.

- No guaranteed launch date
- No guaranteed funding amount
- No announced partner organization
- No guaranteed environmental outcome
- No environmental activity is presented as completed until verifiable evidence is published

Language used for Phase 2 throughout Green365's materials is deliberately conditional — planned, being explored, funding-dependent — rather than definite. Details will be published only once they are real, funded, and finalized.

11 — COMMUNITY AND COMMUNICATIONS

How Green365 Communicates

Green365 is pseudonymous by design: the brand speaks, not a personal name or face. Authority comes from consistency and checkable claims rather than personal credentials, since there is no public identity to vouch with. The founder's voice is intended to be recognizable and consistent across every channel, even without a name attached.

Concerns and Criticism

Public concerns are addressed same-day, publicly, in the founder's own words — never silently, never delegated. Legitimate concerns are acknowledged directly rather than treated as attacks, and where a concern reveals a genuine gap, it is stated plainly along with a concrete next step, rather than spun or dismissed.

Channel Sequencing

Consistent with running as a one-person operation, channels are added deliberately rather than all at once: X is the primary hub from the start; additional channels (such as Telegram) are added once posting cadence and community traction are sustainable, with further expansion only after a consistent track record. This sequencing is a stated plan, not a scheduled promise.

12 — RISKS AND DISCLOSURES

Read Before Participating

G365 is a speculative community token. It does not provide guaranteed returns, guaranteed utility, ownership in a company, dividends, staking rewards, profit sharing, or guaranteed funding for environmental projects. Cryptocurrency assets can be highly volatile, and participants may lose the full value of their tokens.

- **Ownership is not yet renounced** on the mainnet contract (Section 7). While the ownership role cannot mint, pause, blacklist, or modify balances, un-renounced ownership remains a trust factor worth weighing independently.
- **No independent professional audit has been completed** (Section 6). The contract relies on OpenZeppelin's audited base components and public verification, not a third-party audit of this specific deployment.
- **Liquidity is not yet locked** (Section 8). Until a lock transaction is published, liquidity risk associated with an unlocked position applies.
- **Phase 2 is unfunded and uncommitted** (Section 10). No environmental funding, timeline, or outcome should be assumed.
- The project is operated by a single, pseudonymous founder on a bootstrap budget, without a distributed team.

Nothing in this document is financial, investment, tax, or legal advice. Any future presale, staking, reward, yield, dividend, or profit-sharing mechanism would require separate technical development and review by a qualified securities and cryptocurrency lawyer. **None currently exists in this contract or project.**

13 — OFFICIAL LINKS AND CONTRACT ADDRESS

Verify Everything Here

Every claim in this document is designed to be checkable. Use the links below rather than any third-party source claiming to represent Green365.
